Population (2012)

Size and growth

There are 56.749 persons living in Greenland (by January 1st 2012). This has been the size of the population +/- 1000 persons during the past 20 years. Through this period the population has grown slightly except from 2005 to 2009, where the population declined.

Summary table 1
Population by place of birth

	1980	1985	1990	1995	2000	2005	2010	2012
Total	49.647	52.791	55.403	55.732	56.110	56.972	56.452	56.749
Greenland	40.959	43.602	46.151	48.412	49.358	50.275	50.226	50.340
Outside Greenland	8.688	9.189	9.252	7.320	6.752	6.697	6.226	6.409

Source: Statistics Greenland http://bank.stat.gl/beest1

The size of the population and growth over time is explained by changes in the number of live birth, deaths, immigrants and emigrant. In figure 1 you can see the interaction between growth, birth surplus and net migration. Typically the birth surplus and net emigration contributes to a positive growth.

In figure 1 population growth, birth surplus and net emigrations is shown. Throughout the whole period there has been a stable birth surplus and volatile migrations.

Figure 1
Population growth, birth surplus and net emigrations. Total population

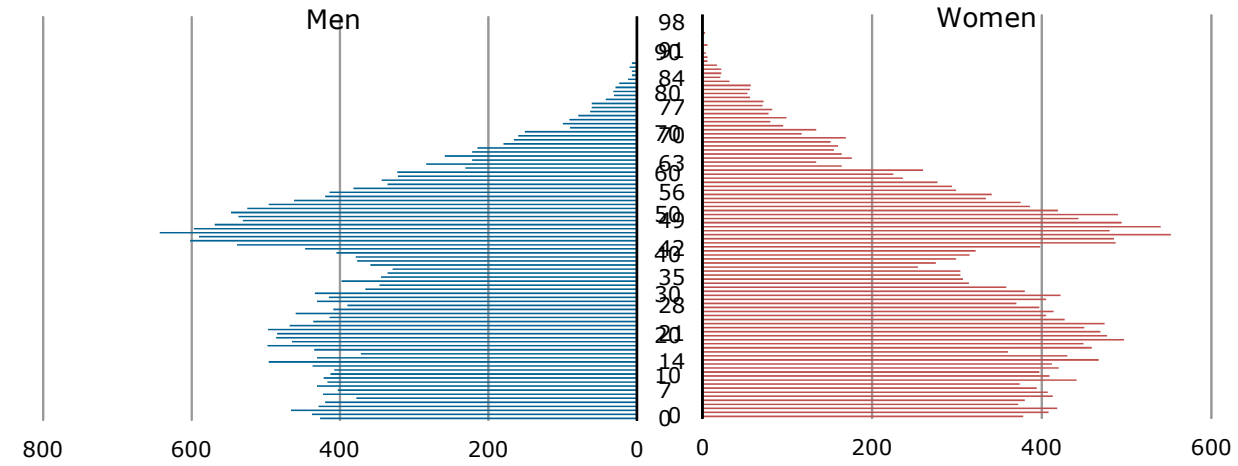

Source: Statistics Greenland, http://bank.stat.gl/beesat1

The birth surplus was extremely high in the early 1960s due to a very high fertility level. Within a few years the fertility level was halved, and the birth

cohorts was equally halved. We talk of 'the big cohorts' from the 1960s. These cohorts were twice as big as cohorts 10 years prior and after. The age-distribution over the past 50 years has been heavily influenced by these cohorts, and are still very visual in a population pyramid. In 2012 the cohorts are between 42 and 52 years old – and in ten years they will be about to retire.

	procent							
Male	54,3	54,3	54,1	53,3	53,4	53,2	53,0	52,9
Female	45,7	45,7	45,9	46,7	46,6	46,8	47,0	47,1

Source: Statistics Greenland http://bank.stat.gl/beest1

There are more males than females living in Greenland as 53 percent of total population is males. Generally there is a surplus of men in the working ages. Only in the oldest age groups women outnumbers men. This is primary due to a group of men, born outside Greenland. This group, attracted by work, consist of double as many men as women.

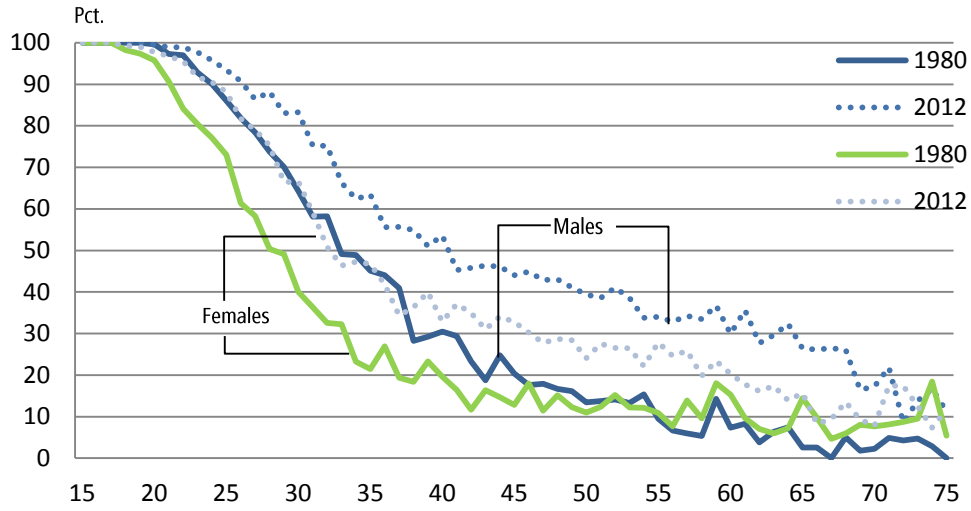

The Greenlandic population is young. 7 percent of the population is over 65 years and less than 1 percent has turned 80 years.

The dependency ratio shows the ratio between people out of the working ages and the number of people in the active ages.

When setting the working ages to 20-64 years, the 'dependency ratio' by January 1st 2011 is calculated to 0.59. This mean, that for every 100 persons

in the working ages, 59 persons, needs support. A view back in time shows, that the 'dependency ratio' in 1979 was 0.89, that is a much higher ratio than today. Ever since the mid 1990s the ratio has been around 65 per 100 in work.
This, by the way, is pretty close to the world average when the working ages are counted as 15- 64 years. (see 2011 World Population Data Sheet Population Reference Bureau - www.prb.org)

Figure 1
Ratio of never-married, born in Greenland by age and gender. 1980 and 2012

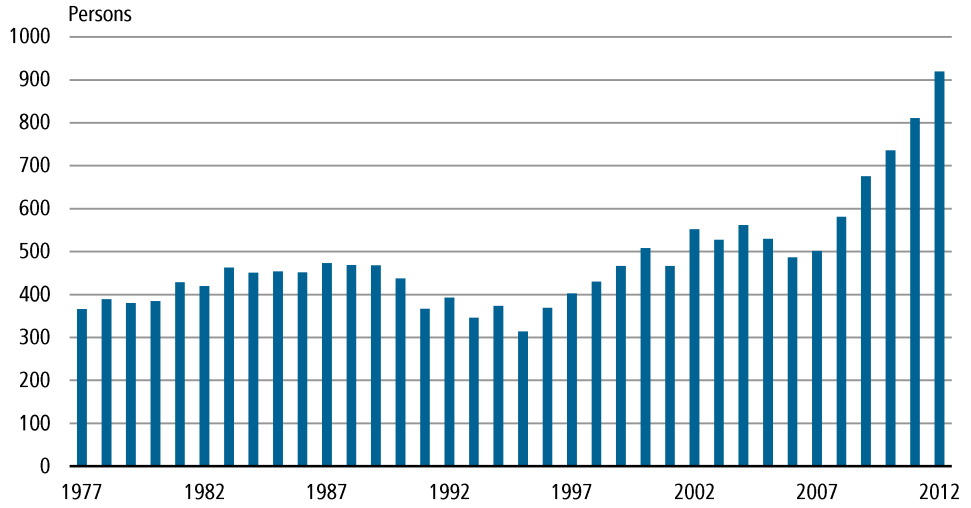

Source: Statistics Greenland, http://bank.stat.gl/beest5

Figure 1 shows that over the past 30 years it has become more common to stay unmarried. This is even more outspoken for men than women.

Place of birth and citizenship
Until a few years ago less than 1 percent of the population had foreign citizenship. As can be seen in figure 2 this is changing and only in the last 5 years the number og foreign citizens has risen by 83 percent.

Figure 2
Foreign citizens. 1977-2012

We often split the population by birthplace with the categories 'born in Greenland' and 'born outside Greenland' as average considerations otherwise will hide important demographic differences between the groups. At the same time the proportion of people born outside Greenland has decreased from 18 percent in 1980 to 11 percent in 2012.

In summary table 2 the population has been tabulated by persons own 'place of birth' as well as parents 'place of birth'. From the table it is seen that 50,340 or 89 percent of the population was born in Greenland.

Summary table 2
Population by own and parents place of birth. 2012

		Both parents birthplace			One parent born in Greenland/ Second parent	
Place of birth	Total	Greenland	Outside Greenland	unknown	Greenland	unknown
Total	**56.749**	**33.776**	**779**	**12.475**	**9.416**	**303**
Greenland	50.340	33.353	317	7.799	8.758	113
Outside Greenland	6.409	423	462	4.676	658	190

Source: Statistics Greenland, http://bank.stat.gl/beeaao3

In summary table 2 the population additionally has been calculated by the parents birthplace. It is seen, that 43.495 (33.776 + 9.416+303) equal to 77 percent of the population has at least one parent born in Greenland. Our archives do not hold information on the parents birthplace for 1/4 of the population. This is either because the parents can't be found in CPR (Danish register on persons), or because the live outside Denmark or Greenland or because they died prior to 1967, when the system was introduced.

Summary table 3
Population with strong family ties to Greenland. 2012

		Both parents birthplace		One parent born in Greenland Second parent born outside Greenland
Place of birth	Total	Greenland	Unknown	
Total	**51.294**	**33.776**	**7.799**	**9.719**
Greenland	50.023	33.353	7.799	8.871
Outside Grenland	1.271	423	..	848

Source: Statistics Greenland, http://bank.stat.gl/beeaao3

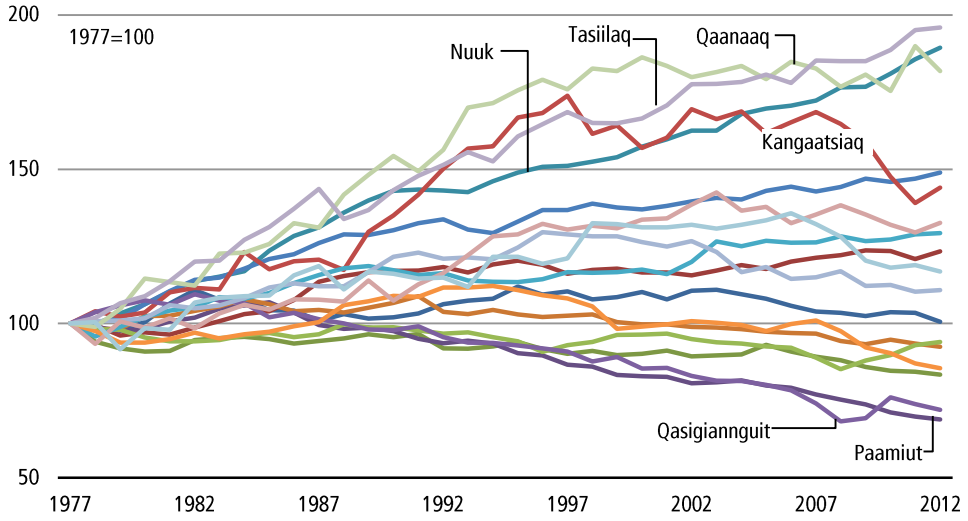

If at least one parent was born in Greenland, the person is said to have strong family ties to Greenland. This includes the persons, where both parents' birthplaces are unknown, if the person in question was born in Greenland. With this definition 51,294 persons has strong family ties to Greenland by 2012. This represents 90 percent of the total population. There is almost no difference in the proportion of people who have strong family ties (90 percent) compared to the proportion of persons born in Greenland (89 percent).

Towns and Settlements
According to Asiaqs' register of localities there are 92 active localities in Greenland by February 18th 2011. A locality can be a town(17), a settlement (62), farm(4), station(6)…

Until the municipal amalgamation January 1st 2009, there was only one city in each municipality, in which municipal administration was found. Following the merger of municipalities we call the old municipalities for districts. A municipality consists of several towns and settlements.

Through the 1960s the population grew rapidly in the towns. The towns absorbed both population growth and the exodus from the settlements. This trend continued over the last 30 years as the population in towns continues to rise while it declines in the settlements. Figure 5 shows total population in the towns 1979-2009. The towns in Nuuk, Qaanaaq and Tasiilaq have almost doubled their population during the period, while the population in Paamiut and Qasigiannguit has been reduced by 25 percent.

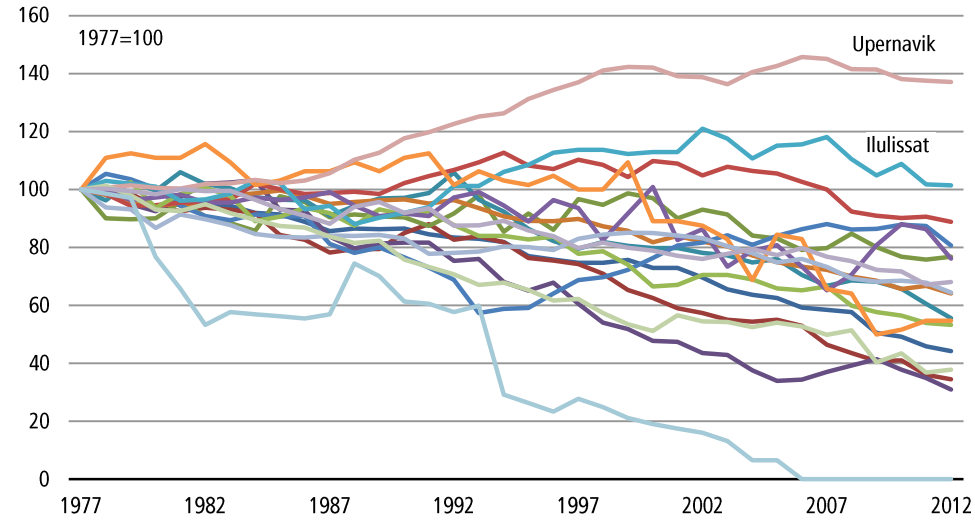

Figure 3
Population trends in towns 1977-2012

Source: Statistics Greenland, http://bank.stat.gl/beest3

Only the settlements in Upernavik and Ilulissat has experienced an increasing population. A number of settlements have been abandoned – partly or totally.

Figure 4
Population trends in settlements 1977-2012

Vital statistics

Fertility

821 live born children were born in Greenland in 2011. Of these 747 were born by mothers born in Greenland themselves, and 74 were born by mothers from abroad.

The annual number of live born can be decomposed into the size of the female population, their age-distribution and their age-specific fertility rates. Fertility often compares by a number of indicators, some shown in summary table 1.

Summary table 1
Fertility indicators 2011

	Total			Mothers born in Greenland			Born outside Greenland		
	1991	2001	2011	1991	2001	2011	1991	2001	2011
Liveborn	1.192	942	821	1.102	856	747	90	86	74
Fertilityrate	21,5	17,0	14,8	23,5	18,2	15,9	10,6	10,1	8,7
Generel fertility	81,8	64,6	56,3	86,4	67,1	58,6	49,5	47,3	40,7
Total fertility	2,431	2,514	2,100	2,507	2,524	2,117	1,748	2,255	1,669
Gross reproduction	1,185	1,225	1,023	1,222	1,230	1,032	0,852	1,099	0,814
Net reproduction	1,143	1,169	0,992	…	…	…	…	…	…

Source: Statistics Greenland, http://bank.stat.gl/beebblsf2

The fertility-indicators gives an overview of fertility and the age-specific fertility rates a more detailed picture. In figure 1 development in the age-specific rates are shown for women, born in Greenland.

The fertility level dropped very sharply in the late 1960s and early 1970s. From 1975 till today, the total fertility rate (the number of children a woman would get if she gives birth in accordance with the annual fertility rates) fluctuated between approximately 2.0 and 2.6 children.

Figure 1
Total fertility 1948-2011, per 1000 women born in Greenland

Source: Statistics Greenland, http://bank.stat.gl/beebbsf1

Over the last 10 years a decline in fertility for women under 25 years can be seen. The total fertility rate is now so low that the population barely can reproduce itself.

Mortality

In summary table 2 the main mortality indicators for 2008 – 2010 can be found. 504 persons died in 2010.

Life expectancy at 0-year equals how old a newborn child can expect to be with the death rates that exist in the different age groups in a given period. Life expectancy for persons born in Greenland have risen by 14.3 years for males and 15.4 years for women in the period from 1954-1958 to 2003 - 2007.

Summary table 2
Mortality indicators

	Total			Males			Females		
	2008	2009	2010	2008	2009	2010	2008	2009	2010

Males	58,4	58,3	58,9	62,0	62,6	64,9	67,1
Females	67,5	65,9	68,0	68,2	68,4	71,1	72,7

Source: Statistics Greenland, http://bank.stat.gl/beedt

Both men and women born in Greenland have shorter life span than those from countries in the Western world. There are two main reasons: Greenland still has a relatively high infant mortality and second high mortality due to accidents and suicides. Deaths due to accident or suicide typically occurs among young men aged 15-35 years. Like deaths among infants these contributes to a significant number of life years lost, far more than the rising number of deaths from cancer and heart disease, which typically occurs later in life.

In Summary table 4 the difference between men and women's age-specific mortality rates are shown.

Summary table 4
Death pr 1000. Persons born in Greenland

Internal migrations

In Greenland internal migration has a significant impact on the regional population size, sex and age distribution. The impact is much greater than the effect of births and deaths and it affects the composition of the population both the locality of migration and the one of removal.

21,941 domestic movements were recorded in 2011. Most movements were within the same locality.

Sumary table 5
Internal migrations

Migrations

Since the 1970s, net migration has varied greatly from year to year. With few exceptions, emigration generally exceeds immigration. In the early 1990s a significant decline in immigration led to a large net outflow, so great, that the birth rate could not prevent a decline in the total population. From 2005 to 2008 net emigration was markedly higher than in previous years, especially among 'persons born in Greenland'.

Summary table 6
Netimmigration by place of birth. 2001-2011

	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011

More than nine of 10 migrations is between Denmark and Greenland. The remaining migrations are primarily to or from the other Scandinavian countries.

Population forecast

Population projections provide estimates of the future size, gender and age composition of the population. It is important to stress that population projections are not accurate predictions about the future, but are the result of calculations determined by assumptions about births, deaths and migration. If our assumptions are not met, the actual developments will deviate from the projection.

Our assumption on fertility and mortality are based on experiences from the period 2007 – 2011, while assumptions on migration is based on the latest 10-year period.

Summary table 1
Population 2013-2021

	2013	2014	2015	2016	2017	2018	2019	2020	2021
Total	56.766	56.782	56.800	56.803	56.815	56.816	56.815	56.790	56.775
Persons born in Greenland	50.295	50.263	50.228	50.194	50.160	50.124	50.089	50.046	49.994
Persons born outside Greenland	6.471	6.519	6.572	6.609	6.655	6.692	6.726	6.744	6.781

Source: Statistics Greenland, http://bank.stat.gl/BEEP2012

I summary table 1 and table 5 results from the projections can be seen. For more details – visit http://bank.stat.gl/BEEP2012 . The forecast is calculated on both 'persons born in Greenland' and those 'born outside Greenland'. The two subpopulations evolve in different directions. The persons born in Greenland, is expected to increase steadily from 50,340 persons in 2012 to 49,994 persons in 2021. The 'persons born outside Greenland' is expected to increase from 6,409 persons in 2012 to 6,781 in 2021. The total population will keep status quo over the next decade.

Methods

Methods

Register on Population Statistics
The basis for the population statistics is Statistics Greenlands Population register. Information in this register is retrieved from the Danish civil registration system (CPR).

Status statements relate to persons who resided in the country per January 1st. The residence criterion is described by the Danish Home Office in 'Guidance on registration of residence in population registers and civil registration'.

Delays in reporting
Births, deaths, movings, etc. are supposed to be reported no later than 5 days after an incident. But some reports are delayed. When calculating the statistics we take this into account and await the delayed reports. There is no time-limit for reporting or correcting information in the system.

Migrations
Information on each incident is reported by the municipal authority, who records information when it comes to their knowledge. Not all people who move are aware of deadlines and their duty to report. When we look at how much time elapses between an incident and when it is reported, we can see that about 60 percent of all immigration and emigration were recorded within the first week.

Number of days between incident and report. 2006

	Immigrants	Emigrants
90 pct.	37 days	31 days
95 pct.	70 days	51 days
99 pct.	226 days	197 days

To provide current statistics to our users, we only wait one calendar month after the status date.
To make it simple, migrations are counted only if there are less than 5 years (1,825 days) between the incident and reporting..

Information from the Danish CPR-system
The Population Statistics Register holds only selected information from the CPR system. It includes no information on a person's attachment to the national church or his name.
The received basic information are sought for errors. Information on sex and age are derived directly from the person number, which only in isolated cases are erroneous. These errors are typically corrected within the child's first year. The locality code is extracted from the register address information. There is generally more uncertainty associated with this information, because there are differences in how the addresses are entered in the registers. From 2009 a location code has been defined to every address, and is used unchanged in the processing and dissemination of statistics. The location code is defined by Asiaq (www.asiaq.gl) and an unofficial rule of thumb indicates that "a locality may not be further apart than one can live and have daily work within the locality."

Concepts

Geographic divisions
January 1st 2009 the country's existing 18 municipalities were merged into the current four municipalities. Given the continued need for statistics on the old municipalities, we use the term 'districts' for the old municipalities. Population statistics are also presented even more detailed, namely on inhabited localities.
Previously we also calculated the group: 'outside of the municipal division' to which we ascribed civilians in the defense areas, defined by a Danish-American treaty in 1951, and weather stations. Kangerlussuaq were subjected Sisimiut municipality in 2001.

Although the municipal amalgamation was implemented 2 years ago, there remain several challenges for the Population Statistics - especially back in time.
Tables in our Statbank (http://bank.stat.gl) show the existing territorial division - also back in time. Hence Kangerlussuaq has been compiled as part of Qeqqata Municipality of Sisimiut district from 1977 onwards.
By August 1st 2010, there is still some uncertainty on historic localities. Population statistics include therefore the term 'other locations'.
Asiaqs register is updated regularly, but the information must be used by the municipals before the Population Statistic Register can use them.

Strong family ties
To have strong family ties to Greenland is defined as a person who's parents were born in Greenland.

Gross reproduction rate (BRR)
The gross reproduction rate (BRR) shows how many live-born girls 1,000 women wil give birth to during the reproductive age. These are from 15 to 49 years. If the 1,000 women give birth in accordance with experience in the period of calculations, and no woman dies before the age of 50.

Parents
In the public registers, information on a person's legal parents is stored. This information is deficient in relation to new-born, because unmarried fathers must first acknowledge paternity. The same applies to persons born before 1960. In the vital statistics on births we use information on biological parents.

Place of birth
Most tables cross tabulates the population by birthplace. There are two categories: 'Born in Greenland' and 'Born outside Greenland'. For a small number of persons the place of birth is unknown. In many tables we assume those to be born outside Greenland.

General fertility rate
Number of live born per 1,000 women in the ages 15-49 years.

Mean population
Mean population is calculated as a simple average of two successive years.

Life expectancy
Life expectancy is the measure that tells the average remaining lifespan for an individual in a given age group. It is assumed that mortality at each age will correspond to the mortality in the period for which the calculations are made.

Neonatal mortality
Number of death in the first four weeks of life per 1,000 live born.
Netreproduction rate (NRR)
The expected number of live born girls, born during their mother's reproductive period from a generation of 1,000 women who give birth and die in accordance with experience gained during the basis period for the calculations.

Perinatal mortality
Number of still born and death in the first week of life per 1,000 born.

Total fertility rate (TFR)
Total fertility rate (TFR) is a measure that tells how many children an 'artificial' generation of 1,000 women will give birth to, through their childbearing ages (15-49 years), provided that none of these women die before the age of 50 and provided, that women bear children in accordance with the experience during the timeframe for the calculations.

Infant mortality
Number of death in the first year of life per 1,000 live born.

Standardized rates
When comparing two populations different age-distributions may cause misleading results. This effect can be eliminated by choosing the same age distribution for the two populations. To reduce the influence of random variations on calendar calculations we often use a 5-year period as a whole.

Population and Population growth

Table 1
Population and Population growth

	Place of birth			Growth by place of birth

Notes:

1) 1901-30: "Natives". 1945-51: "Persons under greenlandic jurisdiction".

2) Northgreenland, in1930 271 persons, all of whom born in Greenland.

3) The large fluktuations in growth was due to technical isues at registration

4) Includes from 1966 and onward the civil part of Kangerlussuaq (Sdr. Strømfjord). 579 persons were added, all except 5 born outside Greenland.

http://bank.stat.gl/beebbd2

Note.: Survivors refers to the lowest birthday in stub. For example, there would be 9,722 in 1986-1990 one-year-old boys of a generation of 10.000. The deathrate indicates the 10,000-share of the risk of dying between the two birthdays in the stub. Life expectancy is the average of the residual lifetimes, there will be claimed by a group, who die according to the life table.
