

Population 2018

Same population estimate as last year

Same population estimate as last year

January 1st 2018 there lived 55.877 persons in Greenland. Thus, the population increased by 17 persons during 2017 and the population count is almost unchanged.

Summary table 1. Population January 1st 2009-2018

In both Kommuneqarfik Sermersooq, Qaasuitsup Kommunia and the new municipality Kommune Qeqertalik the population estimate rose in 2017. Particularly in Nuuk, where the increase amounted to 196 persons. 31.8 per cent. (17,796) of the population now lives in Nuuk.

In total the population estimates for the settlements decreased by 225 persons from 7,356 to 7,131. However, the high displacement in Avannaata Kommunia was not voluntary but caused by the natural disaster that struck the settlements Illorsuit and Nuugaatsiaq in the summer of 2017.

Figure 2. Neighborhoods in Nuuk 1994 – 2018

Source: Statistics Greenland, <http://bank.stat.gl/beestnuk>

The figure below shows the development of migration in the period 1993-2017. On average, 403 more people moved from Greenland than to, each year throughout the period. In 2017 a total of 2,287 people immigrated while 2,736 people emigrated. Net emigration in 2017 was therefore 449 persons, markedly higher than the average annual net emigration since 1993.

The number of foreign citizens has been declining for the past couple of years. In total there now live 970 foreign citizens in the country. From the table in our StatBank it can be found that especially Icelandic citizens have left Greenland (from 204 persons in 2016 to 127 this year). Philippine citizens now counts 215 (22.2 pct) of foreigners in Greenland.

Based on a preliminary calculation of the number of live births and deaths in 2017 shows the key figures for population trends in 2017 (summary table 4)

Summary table 4. Population Account 2017

Population January 1st 2017	55.860
+ number of liveborn (provisional)	859
- number of death (provisional)	499
+ immigrants	2.287
- emigrants	2.736
- Corrections (provisional)	-106
Population Januar 1st 2018	55.877

Detailed tables can be found in our Statbank (<http://bank.stat.gl>)

Households and families

Households and families

The annual statistics on population by January 1st now also includes an estimate of the number of families that can be described by family type.

For the estimates Statistics Greenland uses the same concepts as Statistics Denmark. Read more about the family concepts in www.stat.gl/BED201605/o1 (Danish and Greenlandic only)

In brief, a family consists of one or more persons from the same household, linked to each other through pairings or kinship. A household may consist of multiple families, but a family can in reverse not have members from several households.

Illustration. A household* consisting of 3 families

* A household consists of all persons with identical address in the central register of persons

As of January 1, 2018 there are 55,329 persons in 29,554 families in 22,128 households or 1.3 family per household on average. In addition, 548 persons are registered with an administrative address.

Methods

Register on Population Statistics

The basis for the population statistics is Statistics Greenland's Population register. Information in this register is retrieved from the Danish civil registration system (CPR).

Status statements relate to persons who resided in the country per January 1st. The residence criterion is described by the Danish Home Office in 'Guidance on registration of residence in population registers and civil registration'.

Delays in reporting

Births, deaths, movings, etc. are supposed to be reported no later than 5 days after an incident. But some reports are delayed. When calculating the statistics we take this into account and await the delayed reports. There is no time-limit for reporting or correcting information in the system.

Migrations

Information on each incident is reported by the municipal authority, who records information when it comes to their knowledge. Not all people who move are aware of deadlines and their duty to report. When we look at how much time elapses between an incident and when it is reported, we can see that about 60 percent of all immigration and emigration were recorded within the first week.

Number of days between incident and report. 2013

	Immigrants	Emigrants
90 pct.	31 days	76 days
95 pct.	68 days	218 days
99 pct.	203 days	397 days

To provide current statistics to our users, we only wait one calendar month after the status date.

To make it simple, migrations are counted only if there are less than 5 years (1,825 days) between the incident and reporting. None of the migrations were reported that late in 2017.

Information from the Danish CPR-system

The Population Statistics Register holds only selected information from the CPR system. It includes no information on a person's attachment to the national church or his name.

The received basic information are sought for errors. Information on sex and age are derived directly from the person number, which only in isolated cases are erroneous. These errors are typically corrected within the child's first year. The locality code is extracted from the register address information. There is generally more uncertainty associated with this information, because there are differences in how the addresses are entered in the registers. From 2009 a location code has been defined to every address, and is used unchanged in the processing and dissemination of statistics. The location code is defined by

Asiaq (www.asiaq.gl) and an unofficial rule of thumb indicates that "a locality may not be further apart than one can live and have daily work within the locality."

Concepts

Den 1. januar 2018 blev Qaasuitsup Kommunia delt i 2 kommuner. Da der fortsat er behov for opgørelser vedrørende kommuneinddelingen som gjaldt frem til 2009 anvender vi begrebet 'distrikter', for disse områder. Befolkningsopgørelserne findes også endnu mere detaljeret, nemlig som beboede lokaliteter.

Geographic divisions

January 1st 2018 Qaasuitsup Kommunia was split into 2 municipalities. Given the continued need for statistics on the municipality division prior to 2009, we use the term 'districts' for these areas. Population statistics are also presented even more detailed, namely on inhabited localities.

Previously we also calculated the group: 'outside of the municipal division' to which we ascribed civilians in the defense areas, defined by a Danish-American treaty in 1951, and weather stations. Kangerlussuaq were subjected Sisimiut municipality in 2001.

Although the municipal amalgamation was implemented 2 years ago, there remain several challenges for the Population Statistics - especially back in time.

Tables in our Statbank (<http://bank.stat.gl>) show the existing territorial division - also back in time. Hence Kangerlussuaq has been compiled as part of Qeqqata Municipality of Sisimiut district from 1977 onwards.

By August 1st 2010, there is still some uncertainty on historic localities.

Population statistics include therefore the term 'other locations'.

Asiaqs register is updated regularly, but the information must be used by the municipals before the Population Statistic Register can use them.

Strong family ties

To have strong family ties to Greenland is defined as a person who's parents were born in Greenland.

Gross reproduction rate (BRR)

The gross reproduction rate (BRR) shows how many live-born girls 1,000 women will give birth to during the reproductive age. These are from 15 to 49 years. If the 1,000 women give birth in accordance with experience in the period of calculations, and no woman dies before the age of 50.

Parents

In the public registers, information on a person's legal parents is stored. This information is deficient in relation to new-born, because unmarried fathers must first acknowledge paternity. The same applies to persons born before 1960. In the vital statistics on births we use information on biological parents.

Place of birth

Most tables cross tabulates the population by birthplace. There are two categories: 'Born in Greenland' and 'Born outside Greenland'. For a small number of persons the place of birth is unknown. In many tables we assume those to be born outside Greenland.

General fertility rate

Number of live born per 1,000 women in the ages 15-49 years.

Mean population

Mean population is calculated as a simple average of two successive years.

Life expectancy

Life expectancy is the measure that tells the average remaining lifespan for an individual in a given age group. It is assumed that mortality at each age will correspond to the mortality in the period for which the calculations are made.

Netreproduction rate (NRR)

The expected number of live born girls, born during their mother's reproductive period from a generation of 1,000 women who give birth and die in accordance with experience gained during the basis period for the calculations.

Total fertility rate (TFR)

Total fertility rate (TFR) is a measure that tells how many children an 'artificial' generation of 1,000 women will give birth to, through their childbearing ages (15-49 years), provided that none of these women die before the age of 50 and provided, that women bear children in accordance with the experience during the timeframe for the calculations.

Infant mortality

Number of death in the first year of life per 1,000 live born.

Standardized rates

When comparing two populations different age-distributions may cause misleading results. This effect can be eliminated by choosing the same age distribution for the two populations. To reduce the influence of random variations on calendar calculations we often use a 5-year period as a whole.

Appendix 1. Place of birth, method change 2017

Appendix 1. Place of birth, method change 2017

Since 1993, the population statistics has assumed that persons with unknown place of birth was born outside Greenland. Statistics Greenland has now gathered additional data, which contains more updated information than obtained in the original data collection. Using this information we can now give a more correct estimate of the population birthplace. With this method we now only have a handful of persons with unknown birthplace. These will in all tabulation be counted as 'born in Greenland'.

Moreover, the population estimates for 2002 and 2004 have been adjusted as these were found erroneously to include 30 persons who actually died in 1999.
